Magic Photo Recovery Boosts Performance to Real-Time

East Imperial Soft updates Magic Photo Recovery, the company's dedicated tool for recovering deleted pictures. Version 3.0 features an all-new recovery algorithm, becoming nearly twice as fast as the version it replaces. The newly gained performance boost helps Magic Photo Recovery break the real-time performance barrier, making the speed of recovery only limited by the speed of the storage device being recovered. In addition, Magic Photo Recovery adds Extra-Safe Recovery option by supporting virtual disk images.

Real-Time Performance

Magic Photo Recovery 3.0 features an all-new analysis algorithm doubling its performance compared to the prior release. The performance gain helps Magic Photo Recovery break through the barrier of real-time operation, allowing Magic Photo Recovery to recover lost and deleted pictures with the speed of the disk.

Extra-Safe Recovery

The latest release of Magic Photo Recovery implements a new mechanism making the recovery from physically damaged, badly worn and electronically unstable storage devices safer. The new Extra-Safe Recovery option captures a bit-precise image of the device in a single contiguous read, saving its entire content into a file. The tool then uses that file to proceed with the recovery process. The original storage media is no longer required.

The use of a single contiguous read instead of multiple scan-and-read operations greatly increases the chance of successful recovery of unstable and damaged devices as well as magnetic hard drives with multiple bad blocks.
